From the graph we can say that Orleans pelicans has just over 4% of employees,while Orlando Magic and Minnesota Timberwolves have just under 1% of employees.And the other teams appear relatively even in height, suggesting a fairly uniform distribution of employees across different teams.

The actual counts verify the comparable representation of SG and PF, showing that their numbers are quite close. It is accurate to indicate that PG is greater than SF and C but somewhat lower than SG and PF.The least are C and SF.

The predominant age group among employees is 24 years old, comprising 47 individuals, which suggests a strong interest among adults in basketball.

The plot shows a right-skewed distribution. It rises steeply to the peak at age 24 and then gradually declines. Ages below 24 are less common, and there’s a rapid increase in density up to 24.Ages above 24 show a more gradual decline, suggesting a steady decrease in frequency as age increases.

The graph(relationship between age and salary) shows that, in general, salary tends to increase with age. As individuals gain more work experience, their earnings typically rise.And there’s a significant peak in salary between ages 35 and 40. This suggests that professionals in this age range tend to earn the most.However, the sharp drop after this peak indicates that there might be other factors at play, such as retirement or career shifts.

Los Angeles Lakers(SF) has highest salary expenditure.The team allocates significant resources to small forwards, possibly emphasizing star players or key contributors in that position.

Kobe Bryant, a small forward for the Los Angeles Lakers, earned a salary of approximately $25,000,000. At around 37 years old, this high salary reflects his extensive experience and exceptional skills as a player.
